# Who makes the greenest energy?

Israel

Biofuel from Israel is both green in color and good for the environment. The new algae-based energy source may one day even reverse global warming by trapping greenhouse gas emissions from fossil fuels.

Here's how it works: Israeli producers pump dirty smokestack exhaust through giant pools of sea algae. The algae thrives on the added nutrients and multiplies one-million-fold its natural density in the sea. The plentiful algae then can be harvested as a clean-burning biofuel. Power plant operators from Brazil, Hawaii, Singapore, Italy and India have already expressed interest in this revolutionary Israeli technology.

Helping to make the world a little greener
